

I have serious concerns about the RF interference that this technology may incur to other users of the RF spectrum. Recently, I saw a video of a receiver in a BPL test area. I was amazed at the interference this technology caused. I am appalled at the noise that is being generated while other users like the Civil Air Patrol are striving toward NTIA compliance. I own a software and network engineering company and I would not endorse this technology knowing the interference that other users in the spectrum would receive. There are other cleaner methods of data transmission in place (aDSL / Cable).
